

SAP-Centric EAM 2015

SAP Mobile Work Management

SAP Mobile Work Manager 6.1 Solution

Business Issue

Access to enter SAP work management transactions in the field is critical if you want to progress maintenance at the point of contact. In addition, as your workforce ages you need to have toolsets that allow for you to quickly train new workers in your asset management solution. Today, being successful takes doing more with fewer people, maximizing the value of your assets, and analyzing your every move with the most accurate and complete information you can get. By delivering a set of simplified mobile user interfaces that leverages existing SAP functionality, PwC can provide a more user friendly way to execute your EAM processes in the field.

PwC Solution

PwC works with clients to understand their specific work management business needs and then configures SAP's Mobile Work Manager to meet them. Once configured, workers can view, edit and create orders on the mobile device and report working time and material consumption back to SAP. Next to the current orders, historical order data can be displayed, that is related to technical objects. MWM 6.1 also has the following additional functionality:

- View Linear Asset Data for multiple Technical objects
- Wizard driven Measurement Points reading
- Create and Assign Linear Assets to Orders, Operations, Notifications etc.
- Upload and Download Attachments to Work Orders, Notifications, Equipment's and Functional Locations
- Integration with ESRI GIS
- Integration with SAP 3D Visual Enterprise

Specific configuration makes sure that users only receive the orders relevant to them. SAP's Work Manager supports Windows Tablets/Laptops, iPad/iPhone, Windows Mobile and Android to name a few.

Customer Benefits

- Increases technician productivity by eliminating manual processes
- Makes asset data instantly available for processing, and reporting
- Increases equipment uptime by providing faster and more accurate visibility into maintenance and service activities
- Extends the value of enterprise applications by mobilizing existing business processes
