

SAP Fiori mobile applications

Fiori Mobility

Business issue

Lack of Consumer UX with mobile applications can place a business transformation project at risk of failure. Support multiple types of mobile devices with varying screen sizes and operating systems in a fast, dynamic and evolving mobile device space. This becomes critical once the mobile solution goes live and has to be supported. To keep a lid on the maintenance cost, enterprises are looking for a single code base solutions. Due to fast evolution of mobile devices and operating systems, the mobile solutions have a relatively shorter life cycle and thus they have to be acquired/developed and implemented in a short period (4-6 weeks). Also the skill sets needed for native, MADP based mobile solutions are harder to find.

PwC solution

PwC works with clients to understand their specific mobile solution needs, and then implements the suitable SAP Fiori applications in a short span of time. The Fiori based enterprise mobile applications provide a consumer grade user experience (simple and intuitive), are supported on all HTML5 compliant browsers across smartphones, tablets and laptops.

PwC has a global network of over 1200 mobile professionals and can bring in SAP trained SMEs to support all phases of Fiori applications including planning, designing and end-to-end implementation. The UI for these applications are based on generic technologies like HTML5, Javascript, CSS and thus in-house resources can be trained and leveraged.

Customer benefits

- Gain productivity
- Increase User Adoption
- Decrease User errors
- Optimize Training Costs
- Simple and easy to adopt
- Responsiveness and speed – accelerated implementation
- Provides Consistent User experience across mobile applications
- Promotes process compliance
- Supports “Single Version of the Truth”
