CISOs will invest in eliminating threats and reducing costs, enhancing UX and risk posture

The year 2022 saw multidimensional challenges, which helped revolutionize the U.S. cybersecurity market from different perspectives. In that year, the U.S. witnessed more than 1,800 reported breaches, which was slightly lower than in 2021, which saw 1,862 incidents. However, the sophistication of the attacks was significantly higher in 2022, with more than 422 million individuals impacted compared with 298 million in 2021. The decline in breaches was partially due to federal laws that issued rulings to report only during actual damage and not for a potential one. While most large firms issued a breach notice, the notices had little to no information on the extent and impact of the attacks. Industry sources cite that the average time to identify a breach is about 207 days, which is almost half a year; the impact of the breaches is either unknown or not investigated further.

The second half of 2022 witnessed changes, with the U.S. government recognizing the need for strong regulations and policy changes that would encourage enterprises to invest in holistic cybersecurity solutions to protect their business and their clients. While the National Cybersecurity Strategy is aimed at prioritizing cybersecurity as a critical component of the economic prosperity and national security of the U.S., it also addresses the fundamental notion that the private sector holds the key to the public good of cybersecurity.

ISG is of the view that a large portion of the SMB market is invariably linked to large corporations directly and indirectly as part of a larger supply chain. Therefore, it is imperative for SMBs to invest in appropriate security measures to address all vulnerabilities and fill gaps in controls and policies; in short, approach security as a holistic responsibility across the business environment.

ISG's analysis indicates that U.S. enterprises continue to face challenges like their counterparts in other regions. However, the market shows a stark distinction in approach and investment, given the varied levels of

Cybersecurity
initiatives must
align with business
priorities for
strategic resilience.

digital transformation between large and small enterprises. Therefore, the approach to identifying challenges and the ensuing activities to ensure a secure environment is largely aligned with the enterprise's digital maturity, irrespective of its size.

ISG has identified the following challenges enterprises face:

- Expensive attacks and threats: U.S. enterprises continue to face increasingly sophisticated attacks, with cybercriminals employing complex and creative methods. Enterprises struggle to identify threats from unprotected devices and endpoints. vulnerabilities in applications and software, cloud misconfigurations and control policies, legacy infrastructure and internal threats. The cost of a data breach has increased over the years, with increasing expenses related to lost opportunities, regulatory fines and forensic investigation. Attackers are using sophisticated phishing techniques, malware and ransomware to target unsuspecting enterprises. In 2022, cybercriminals were specifically targeting enterprises in the healthcare and education
- sectors. The cost of a breach, especially in the healthcare sector, is exponentially high in the U.S. with the loss of confidential patient data. Moreover, the healthcare sector is connected to several other critical industries, including banking, finance, payments and insurance, making it particularly attractive for malicious intent.
- Supply chain attacks: Cybercriminals have been attacking weak links in the enterprises' supply chains, such as their customers, third-party vendors and suppliers. Software supply chain attacks are expected to be the largest reason for compromised identities and data leakage. Enterprises can no longer remain satisfied with just securing their perimeters and plugging vulnerabilities but must also ensure that their partners and suppliers adhere to the highest standards of security. The situation becomes further complex as enterprises increasingly wish to adopt open-source software and develop applications in the cloud, prompting software developers to unintentionally use libraries available online. Threat actors have utilized these channels to embed malicious code
- and exploit the entire chain of enterprises with targeted attacks. Enterprises are struggling to adopt policies and procedures to undertake continuous assessments and audits of their supply chain partners to ensure changes in behavior, detect vulnerabilities and deception techniques and develop agile isolation capabilities.
- Government regulations and sanctions: The announcement of the National Cybersecurity Strategy policy also indicates that the government and the public are aware of the importance of undertaking voluntary cyber hygiene programs and, at the same time. are aware of the recurring failures due to the soft enterprise measures. The strategy takes recourse in new regulatory frameworks that shift accountability, incentivizing enterprises to set up the appropriate defense against critical vulnerabilities. The U.S. Securities and Exchange Commission (SEC) also proposed cybersecurity measures in 2022 that came into effect in April 2023, once again highlighting the understanding among C-level executives of the criticality of security risks and the requirement for

increased transparency in dealing with breaches and threats. Enterprises will be required to disclose cybersecurity experience of board of directors on their 10-K and 8-K forms, governance methods and risk analysis and management processes and incidents deemed malicious within four days of determining that such a situation has occurred.

IoT and transformation initiatives:

Enterprise investments in digital technologies toward their transformation journeys, with IoT, AI and ML, have resulted in increased vulnerabilities that are unknown and inconspicuous. The adoption of IoT has increased the number of endpoints, with enterprises sometimes having little to no visibility of the entire network comprised of a large number of devices. Moreover, some IoT devices and deployments do not follow standard protocols, leaving them vulnerable to attacks, and the limited security integration capabilities make them impossible to protect. Apart from limited visibility, IoT poses other challenges arising from the use of open source software,

unpatched vulnerabilities, APIs and weak password protection. The increased sprawl of IoT devices also means that attackers will no longer exploit individual endpoints but the entire network to create botnets for extensive distributed denial of service (DDoS) attacks. These attacks, especially on critical infrastructure, will prove to be devastatingly costly from both a monetary and a socioeconomic perspective.

• Skills and gap talent: U.S. enterprises continue to face a shortage of cybersecurity talent and skillsets, with industry sources citing nearly 700,000 unfilled positions. Apart from the explosive growth of technology becoming a challenge for cybersecurity professionals, enterprises are also struggling to retain employees due to their requirements for multiple certifications and years of experience and the investments needed to keep skills up to date. Industry sources cite that the average experience for cybersecurity professionals is around six years across U.S. enterprises, further creating challenges with handling legacy security tools and solutions. Moreover, enterprises

- are struggling to retain employees due to the change in work culture post-pandemic, and because of competition from technology startups offering attractive packages and career opportunities, which is triggering job hopping.
- Remote and hybrid work: Although enterprises are expecting and urging employees to return to work, the work culture and workplace have undergone a significant evolution with the adoption of emerging technologies. Enterprises are challenged by their expanded perimeter due to the investment in devices, endpoints. cloud and applications that are enabling remote and hybrid work. These factors have contributed to the increased attack surface and vulnerabilities because most of these investments were focused on attaining uninterrupted operations, but without the necessary diligence and control policies in place. Enterprises are also challenged by limited visibility across devices and applications and from complexities arising from insider threats.

Enterprises are taking necessary initiatives to reduce attack surface by focusing on the following

- Focus on business resilience: Since 2021 cyber resilience has been gaining mindshare among C-level executives across U.S. enterprises, with 2022 seeing the evolution of resilience widening to include business and operational aspects. While enterprises have been investing in intelligence-led detection and response solutions, they are also keen on investing in rapid recovery and business continuity capabilities. U.S. enterprises understand that investing in point solutions will not suffice; they need to take a holistic approach, assessing their risk appetite and maturity in implementing relevant solutions that mitigate business risks. Enterprises view resilience as a key factor in bolstering their ability to survive in the face of threats and for maintaining trust, responsibility and accountability, while ensuring high levels of CX.
- Industry-aligned cybersecurity: Enterprises are investing in identifying vulnerabilities and risks that are unique to their business

- and ecosystem and are taking proactive measures to test and understand their threat landscape. With attackers targeting specific industries such as healthcare, utilities, automotive and education, enterprises are keen on investing in cybersecurity solutions that align better with their industry-specific regulations, threats and attack vectors. Besides compliance, controls and frameworks, attackers are exploiting similarities in unpatched vulnerabilities and backdoors to launch phishing campaigns that lead to breaches
- Zero trust and SASE: As more enterprises invest in the cloud as a way to achieve digital transformation and support remote and hybrid workers, the Zero Trust framework has become an imperative investment. The framework's Never Trust, Always Verify tenet helps address multiple aspects, including perimeter-less enterprises, mutual authentication, explicit scrutinization, continuous monitoring and microsegmentation of the network. The framework requires a thorough understanding of existing security solutions

and requires phased investments to consistently deploy security measures deemed relevant for an enterprise. Security service edge (SSE) is another approach that supports their cloud migration journey and allows enterprises to start with small investments and progress rapidly.

• Adhering to regulations: Enterprises seek to undertake continuous and periodic risk assessments and audits across different areas, covering changes related to business strategy, supply chain, M&A and financial exposure. Apart from this, spending is focused on conducting periodic vulnerability scans and penetration tests to identify access points that are not secure and visible to security analysts. CISOs engage with providers that have red teams to simulate sophisticated cyberattacks to better understand vulnerabilities and weak access points and determine how adversaries can access sensitive data or disrupt networks. Enterprises are also adopting stricter measures and processes to thoroughly assess third-party vendors and software suppliers to minimize the

risk of attacks through the supply chain.
From a prevention perspective, enterprises will become more cautious and invest in measures, including patching known exploits and deploying anomaly detection tools. As a comprehensive and overall strategy, they are investing in strong response and recovery plans to minimize the scale and impact of breaches.

• Human-centric training and awareness: Enterprises focus on providing awareness training to their employees to embed a cybersecurity-centric culture that would help reduce human errors and internal threats. Enterprises are also seeking innovative and user-oriented training that would help beyond just certification and instill a cybersecurity culture. Enterprises are willing to invest in multi-pronged security training to ensure a better understanding of sophisticated attack campaigns and vulnerabilities. Apart from addressing data breach, the trainings are expected to help address areas such as improved compliance, UX, employee well-being and customer assurance.

Considering there are challenges in aligning the CISO and overall enterprise objectives, ISG has analyzed CISO-specific challenges that hamper the effective security of an enterprise.

- · Recessionary fears impacting budgets: CISOs are faced with constrained budgets, with the fear of a looming recession undermining their ability to defend their businesses against the ever-increasing frequency and sophistication of attacks. In some cases, budget reduction results in an executive board contemplating the right balance between ROI and the possibility of an actual attack. The economic headwinds have strained the ability of the CISO to invest in security solutions or hire relevant cybersecurity personnel. CISOs are struggling to allocate budgets and prioritize security solutions and services that would help drive value and enhance risk posture.
- Fatigue and alerts: Security teams are swamped with work related to alerts, tools, technologies and intelligence, and other challenges. While these teams must learn to adapt themselves to emerging security technologies, they also need to gain a better
- context and understanding of the behavior of attackers and indicators of compromise (IoC), which would help them identify breaches and vulnerabilities. While most existing solutions offer alerts, the increased recurrence is likely to have an adverse impact on adherence to safety protocols. The market is also flooded with multiple tools and technologies claiming to have the ability to address security threats and attacks, making it difficult for security professionals to choose the optimal solution for their infrastructure. The market is also facing the challenge of incorrect information related to threat intelligence, which further puts a strain on security analysts, creating distrust and fatigue and affecting their morale and effectiveness.
- Tool sprawl: U.S. enterprises have an average of more than 25 security tools and solutions in place, according to industry sources.

 This volume complicates management and creates challenges in providing effective security. Apart from the challenges arising from legacy systems and related outdated and unpatched vulnerabilities, the lack

of technical support and tool sprawl lead to other issues, including difficulties in integration with other tools and operationalizing them. Tool sprawl is also identified as the cause of increased fatigue and burnout while enterprises struggle to find appropriate talent to offer support with these technologies.

Cloud security: The unprecedented rate at which enterprises are adopting the cloud has prompted CISOs to quickly understand the security boundaries of their enterprises and determine responsibilities. Cloud misconfigurations have been cited as the most common area of security compromise, leading to the loss of data to cybercriminals. CISOs are also challenged with identifying where the data resides and when it is in motion to aid a better security posture throughout the data lifecycle.

CISOs are actively seeking the following solutions and services that will help them to improve the current situation.

 Aligning with business objectives: CISOs are looking for solutions and services that help them better prioritize their

- cybersecurity initiatives and align them with enterprise business objectives. Apart from monitoring the threat landscape, CISOs are keen on educating board members on risk management capabilities relevant to an enterprise to ensure business resilience and growth. CISOs are looking to invest in solutions that can address industry-specific security threats, fostering a comprehensive security culture, creating awareness about insider threats and making cybersecurity a business problem rather than a technology problem.
- Tool and vendor consolidation: CISOs are looking for solutions that help address tool sprawl and technology rationalization. Cybersecurity services and solutions that enable better integration with existing tools and deliver intelligence to enable the appropriate response will gain traction. CISOs will invest in solutions that help them consolidate various tools and technologies, yet offer holistic detection and risk mitigation functionalities. They are no longer keen on investing in best-of-breed capabilities, but rather on integrated product

- suites and single vendor platforms that will offer relevant risk management better suited for an enterprise's risk appetite.
- Risk prioritization and quantification: CISOs are investing in risk assessments and audits that help to better prioritize threats and risks specific to their business. Cybersecurity solutions and services that offer in-depth intelligence with industryaligned assessments that consider supply chain risks are gaining traction. Although in the early stages, CISOs are investing in risk quantification solutions that allow them to engage and convince C-level executives to invest in appropriate security technologies. While the market is flooded with comparable scoring and benchmarking tools, CISOs are preferring solutions that can quantify risk in terms of monetary losses, which enables them to prioritize as well as educate board members to take appropriate security measures.
- Al- and automation-driven intelligence:
 Security teams are looking for solutions with the highest level of automation. Al that can sift through alerts and logs to provide

- in-depth threat intelligence. Besides alert fatigue, CISOs are investing in human-centric solutions that leverage context- and behavior-led engines to detect threats and vulnerabilities. In addition to mitigating threats, these solutions offer intelligence to understand the kill chain and malicious behavior to prepare for and prevent such attacks in the future.
- Utilizing outsourced services: Managed services will become the new normal and de facto choice for enterprises, across different sizes, given the complex threat environment and lack of talent. CISOs will look for solutions that can integrate better with existing security tools or invest in integrated suites with extended detection and response (XDR) capabilities across the IT environment. CISOs will invest in MDR. XDR and MXDR solutions and services that consolidate intelligence across the IT infrastructure and security tools and prioritize them with remediation, including isolation of threats handled by security experts from an advanced SOC.

Notes on quadrants: The Security Service Edge (SSE) quadrant is analyzed from a global perspective, given its early stages of maturity and because enterprises taking a phased approach to investing in these solutions.

Notes of quadrant positioning: In this study, several security services and solution providers that offer similar portfolio attractiveness in most quadrants are assessed. This reflects the relative maturity of the market, providers and offerings. It is a given that not all are equal in circumstances. The vertical axis positioning in each quadrant reflects ISG's analysis of how well the offerings align with the full scope of enterprise needs. Readers will also note similarities in portfolio axis (vertical axis) positioning with providers included in ISG's Provider Lens™ U.S. Public Sector Cybersecurity Solutions and Services study.

Cybersecurity can no longer be restricted to only preventing attacks and defending against cyber criminals with sophisticated malware and ransomware but needs to evolve to better understand cyber risks and recovery capabilities to ensure business resilience. As businesses increasingly shift to the cloud and adopt emerging technologies, enterprises will seek cybersecurity solutions/services that offer enhanced visibility and risk management.

Definition

The year 2022 could be termed as tumultuous from a cybersecurity perspective; although there was a decrease in data breach incidents, the year saw significantly increased sophistication and severity in the attacks. In 2022 enterprises increased their investment in cybersecurity and prioritized relevant initiatives to prevent attacks and improve their security posture. The continued learnings from the 2021 attacks led to executives and businesses of all sizes and across industries investing in measures to respond to and survive cybersecurity threats and cyberattacks.

Even small businesses understood the impact of cyberthreats and realized that they are actively targeted and are highly vulnerable to cyberattacks. This reinforced the need for (managed) security services and cyber resiliency services that would enable businesses to recover and resume operations quickly after a cyber incident. Service providers and vendors are, therefore, offering services and solutions that help in recovery and business continuity.

Introduction

From the perspective of the cybercriminals, they began exploiting large-scale vulnerabilities, such as Log4shell, and continued using ransomware to disrupt business activities, specifically targeting healthcare, supply chain and public sector services.

These prompted businesses to invest in capabilities such as identity and access management (IAM), managed detection and response (MDR) and securing cloud and endpoints. The market is shifting toward integrated solutions, such as security service edge (SSE) and extended detection and response (XDR), which leverage the best tools and human expertise and are augmented with behavioral and contextual intelligence and automation to deliver a superior security posture.

Introduction

Scope of the Report

In this ISG Provider Lens™ quadrant report, ISG covers the following six quadrants for services/solutions: Identity and Access Management (IAM), Extended Detection and Response (XDR), Security Service Edge (SSE), Technical Security Services, Strategic Security Services and Managed Security Services (SOC), the latter of which is divided into Large Accounts and Midmarket quadrants.

Vendors offering Security Service Edge (SSE) solutions are analyzed and positioned from a global perspective, rather than by individual regions, as the market is yet in the early stages of maturity.

This ISG Provider Lens™ study offers IT decision makers with the following:

- Transparency on the strengths and weaknesses of relevant providers/software vendors
- A differentiated positioning of providers by segments (quadrants)
- Focus on regional market

Our study serves as the basis for important decision-making in terms of positioning, key relationships and go-to-market considerations. ISG advisors and enterprise clients also use information from these reports to evaluate their existing vendor relationships and potential engagements.

Provider Classifications

The provider position reflects the suitability of IT providers for a defined market segment (quadrant). Without further additions, the position always applies to all company sizes classes and industries. In case the IT service requirements from enterprise customers differ and the spectrum of IT providers operating in the local market is sufficiently wide, a further differentiation of the IT providers by performance is made according to the target group for products and services. In doing so, ISG either considers the industry requirements or the number of employees, as well as the corporate structures of customers and positions IT providers according to their focus

area. As a result, ISG differentiates them, if necessary, into two client target groups that are defined as follows:

- **Midmarket:** Companies with 100 to 4,999 employees or revenues between \$20 million and \$999 million with central headquarters in the respective country, usually privately owned.
- Large Accounts: Multinational companies with more than 5,000 employees or revenue above \$1 billion, with activities worldwide and globally distributed decision-making structures.

The ISG Provider Lens™ quadrants are created using an evaluation matrix containing four segments (Leader, Product Challenger, Market Challenger and Contender), and the providers are positioned accordingly. Each ISG Provider Lens™ quadrant may include service providers that ISG believes have strong potential to move into the Leader quadrant. This type of provider can be classified as a Rising Star.

• Number of providers in each quadrant: ISG rates and positions the most relevant providers according to the scope of the report for each quadrant and limits the maximum of providers per quadrant to 25 (exceptions are possible).

Introduction

Provider Classifications: Quadrant Key

Product Challengers offer a product and service portfolio that reflect excellent service and technology stacks. These providers and vendors deliver an unmatched broad and deep range of capabilities. They show evidence of investing to enhance their market presence and competitive strengths.

Leaders have a comprehensive product and service offering, a strong market presence and established competitive position. The product portfolios and competitive strategies of Leaders are strongly positioned to win business in the markets covered by the study. The Leaders also represent innovative strength and competitive stability.

Contenders offer services and products meeting the evaluation criteria that qualifies them to be included in the IPL quadrant. These promising service providers or vendors show evidence of rapidly investing in products/ services and a follow sensible market approach with a goal of becoming a Product or Market Challenger within 12 to 18 months.

Market Challengers have a strong presence in the market and offer a significant edge over other vendors and providers based on competitive strength. Often, Market Challengers are the established and well-known vendors in the regions or vertical markets covered in the study.

* Rising Stars have promising portfolios or the market experience to become a Leader, including the required roadmap and adequate focus on key market trends and customer requirements. Rising Stars also have excellent management and understanding of the local market in the studied region. These vendors and service providers give evidence of significant progress toward their goals in the last 12 months. ISG expects Rising Stars to reach the Leader quadrant within the next 12 to 24 months if they continue their delivery of above-average market impact and strength of innovation.

Not in means the service provider or vendor was not included in this quadrant. Among the possible reasons for this designation: ISG could not obtain enough information to position the company; the company does not provide the relevant service or solution as defined for each quadrant of a study; or the company did not meet the eligibility criteria for the study quadrant. Omission from the quadrant does not imply that the service provider or vendor does not offer or plan to offer this service or solution.

Who Should Read This Section

In this quadrant, ISG evaluates service providers specializing in strategic security services (SSS) for companies across industries in the U.S. that can assess the security maturity and risk posture of these enterprises to define tailored cybersecurity strategies.

ISG defines the current positioning of SSS players in the U.S. with a comprehensive overview of the market's competitive landscape.

The increased focus of enterprises on cyber resiliency is driving the strategic security services market in U.S. Enterprises are seeking consulting services to formulate business continuity roadmaps and prioritize business-critical applications for data recovery. Cyber risk profiling and quantification services are gaining momentum as they allow businesses to prioritize their risk management efforts, based on the severity and likelihood of different cyber threats. Enterprises are also actively engaging stakeholders in cybersecurity programs since there is a strong need for creating an error-proof security architecture. With increased focus on security risks at

the executive level, enterprises prioritize security awareness and training services to help board members, key business executives and employees develop cyber literacy and establish best practices to better respond to cyberattacks. In the meanwhile, there is also a significant demand from the midmarket for broad cybersecurity services that extend beyond threat detection and response.

Providers can capitalize on this demand by offering the right advisory capabilities and resources, ensuring constant technical environment maturity and developing advanced threat defense solutions tailored to their specific needs.

Cybersecurity professionals should read this report because it gives a broad perspective on security trends. It highlights providers' capabilities in helping enterprises devise security strategies.

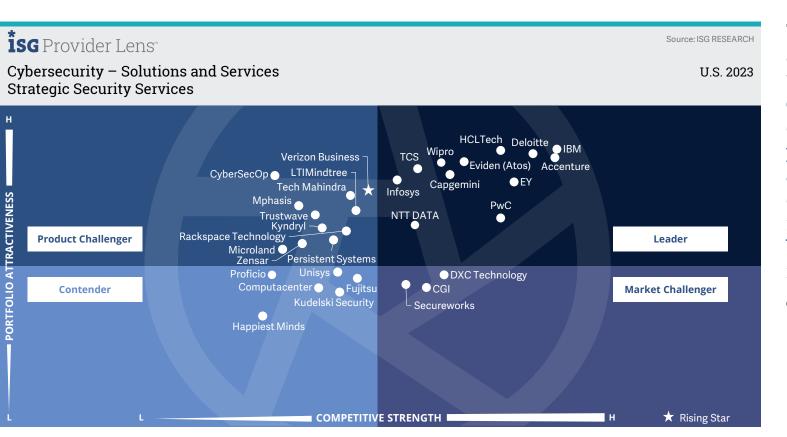

Strategy professionals should read this report to determine the vision and strategy for enterprise security. It supports decision-making on partnerships and helps in taking cost-reduction initiatives.

Technology professionals should read this report because it highlights the emerging trends in the security landscape. It also gives insights into providers' abilities to develop tailored security platforms.

This quadrant assesses service providers that employ **security** consultants with extensive experience in planning, developing and managing end-toend security programs for enterprises with business continuity roadmaps for **recovery**.

Gowtham Kumar Sampath

Definition

The Strategic Security Services (SSS) providers assessed for this quadrant offer consulting for IT and OT security. The services covered in this quadrant include security audits, compliance and risk advisory services, security assessments, security solution architecture consulting, and awareness and training. These services are used to assess security maturity and risk posture and define cybersecurity strategies for enterprises (tailored to specific requirements).

SSS providers should employ security consultants that have extensive experience in planning, developing and managing end-to-end security programs for enterprises. With the growing need for such services among SMBs and the lack of talent availability, SSS providers should also make these experts available on-demand through vCSIO (virtual chief security information officer) services. Given the increased focus on cyber resiliency, providers offering SSS should be able to formulate business continuity roadmaps and prioritize business-critical applications for recovery.

ISG Provider Lens

They should also conduct periodic tabletop exercises and cyber drills for board members, key business executives and employees to help them develop cyber literacy and establish best practices to better respond to actual threats and cyberattacks. They should also be adept with security technologies and products available in the market and offer advice on choosing the best product and vendor suited to an enterprise's specific requirements.

This quadrant examines service providers that are not exclusively focused on proprietary products or solutions. The services analyzed here cover all security technologies, especially OT security and SASE.

Eligibility Criteria

- 1. Service providers should such as evaluation, assessments, vendor selection, architecture consulting and risk advisory.
- 2. Service providers should offer at least one of the above

- 3. The ability to execute security consulting services using frameworks will be an advantage.
- 4. No exclusive focus on proprietary **products** or solutions.

Observations

space are:

Advisory and consulting continue to remain the entry and foundational phase of most engagements in the cybersecurity market. Strategic security services have seen significant demand in the backdrop of enterprise digital transformation initiatives. Many enterprises are struggling with their existing security infrastructure due to the vast number of tools, solutions and systems they've adopted to address ad-hoc, independent challenges. Some of the other developments in this

- The increased focus on business resilience has created a demand for offerings that align cybersecurity with business priorities. In this environment, enterprises prefer providers that have a notable understanding of the business context with considerable vertical experience.
- Service providers are witnessing increased demand for services and solutions with next-generation technologies that address areas such as cloud security, identity and

- access management (IAM), secure access service edge (SASE), zero trust and IT/OT security.
- There is strong demand for integrated training and awareness offerings that foster a culture dedicated to cybersecurity among employees and board members. Providers are developing standardized trainings such as tabletop and cyber crisis exercises with red/blue/purple teaming, plus threat management, incident response and other services.
- Cybersecurity solutions and services that include in-depth intelligence with industry-aligned assessments, including supply chain risks, are gaining traction.
- Chief Information Security Officers (CISOs) are preferring solutions that quantify risks, in terms of their monetary implications.
 This enables them to prioritize as well as educate board members to take appropriate security measures.

From the 261 companies assessed for this study, 32 have qualified for this quadrant with 12 being Leaders and one a Rising Star

accenture

Accenture's competitive advantage stems from its significant technical expertise and expansive network of partners from the technology industry, academia and external security researchers, combined with dedicated internal cybersecurity resources.

Capgemini

Capgemin's Applied Innovation Exchange (AIE) network helps drive innovation and collaboration with clients, allowing them to contextualize their requirements within their specific industry. The approach allows enterprises to gain industry- and business-aligned advisory to mitigate risks.

Deloitte

Deloitte relies on undertaking a data discovery process before assessing the findings from both value and cost perspectives to offer advisory services, assisting enterprises with the technical and strategic aspects of data management.

Eviden (Atos) has made multiple consultingbased acquisitions, including of Fidem and SEC Consult Group, particularly to enhance its advisory portfolio. It can offer vertical-specific capabilities and enable enterprises to achieve cyber resilience.

ΕY

EY's consulting portfolio is complemented by its next-generation security operations and response services that help enterprises build a transformation strategy and roadmap through advanced security operations.

HCLTech

HCLTech uses a 360-degree security framework and consulting approach, backed by a competent services delivery model, to provide superior levels of security to its clients, focusing on people, processes, technology and culture to maintain leadership in the market.

IBM

IBM's security intelligence operations and consulting services are aimed at helping clients develop maturity in intelligence-driven operations across their IT environments. The IBM X-Force Command Center offers first-hand knowledge-enhancing advisory capabilities.

Infosys*

Infosys leverages technologies that are enhanced with proprietary content, gained from vast research and rich experience obtained through use cases, playbooks, standard operating procedures (SOPs), security metrics and architecture.

NTT DATA

NTT DATA relies on powerful risk management capability, combining security information and event management (SIEM) and IT system data directly into a proprietary application to quantify risk exposure. The company supports more than 200 different vendor technologies.

PwC's offerings are designed to support the transformation journey and allay associated risks in adopting emerging technologies for its clients. It offers a simulation platform capable of mimicking real-world threat scenarios to help CISOs address the concerns of C-level executives.

TCS' cybersecurity team has deep domain and industry experience to contextualize cybersecurity programs to specific client business needs and risk appetite. The company's focus areas include OT/IoT, cloud, forensics, incident response professional services, development, integrations and cyber risk and resiliency.

Wipro offers its clients a combination of innovative platform-based security solutions, a unique risk-based approach and the experience of more than 6,000 security experts to improve their security posture.

verizon\(

Verizon Business (Rising Star) offers strong advisory capabilities addressing risk, network and quality of experience for clients. It takes a unique asset-based risk quantification approach, customizing actions specific to the existing solutions and risk postures of enterprises.

"PwC has built excellent SSS capabilities that align risk management with enterprise business objectives to deliver an effective cyber risk management program that yields quantifiable results."

Gowtham Kumar Sampath

PwC

Overview

PwC is headquartered in London, U.K. and operates in 152 countries. It has more than 327,900 employees across 690 global offices. In FY22 the company generated \$50.3 billion in revenue, with Advisory as its largest segment. PwC provides end-to-end strategic security services that encompass cyber risk assessments, risk quantification, incident response, disaster recovery, crisis management, supply chain security and tabletop exercises, cloud, IoT and zero trust security strategy.

Strengths

Trusted advisor to C-level stakeholders:

PwC has the breadth of skills and capabilities to support a plethora of cybersecurity and risk management needs as part of PwC's Cybersecurity, Risk and Regulatory (CR&R) practice. It has helped C-level stakeholders with guidance and current intelligence for cyber governance. PwC's engagements are intelligence led and risk based, enabling both business and technology leaders to make informed decisions by considering risks, while being mindful of costs.

Strong value proposition: Through its Cyber Fit for Growth and other supporting methodologies, the company ensures that an enterprise's business goals align with the processes, technologies and people required to secure their ecosystem. PwC's platform of risk products and digital assets extends its strategic security services beyond risk identification, allowing clients to measure and monitor the effectiveness and value of their security strategy.

Array of tools and IPs: PwC has a variety of licensable software, digital assets, frameworks, methodologies and tools related to cybersecurity and related risks and continues to invest in R&D to enhance its IP portfolio to offer cyber-embedded solutions to enterprises. These IPs are often co-developed with clients, demonstrating PwC's commitment to driving integrity and quality in client engagements.

Caution

PwC should continue to invest and further promote its cybersecurity awareness training that helps foster a cyber culture for its clients.

PwC should actively address and create thought leadership around the rationalization of supply chain risk management technology and vendor consolidation.

Appendix

Methodology & Team

The ISG Provider Lens™ 2023 – Cybersecurity – Solutions and Services report analyzes the relevant software vendors/service providers in the U.S. market, based on a multi-phased research and analysis process, and positions these providers based on the ISG Research™ methodology.

Information Services Group Inc. is solely responsible for the content of this report. Unless otherwise cited, all content, including illustrations, research, conclusions, assertions and positions contained in this report were developed by, and are the sole property of Information Services Group Inc.

The research and analysis presented in this report includes research from the ISG Provider Lens™ program, ongoing ISG Research™ programs, interviews with ISG advisors, briefings with services providers and analysis of publicly available market information from multiple sources. The data collected for this report represents information that ISG believes to be current as of June 2023, for providers who actively participated as well as for providers who did not. ISG recognizes that many mergers and acquisitions have taken place since that time, but those changes are not reflected in this report.

All revenue references are in U.S. dollars (\$US) unless noted

The study was divided into the following steps:

- 1. Definition of Cybersecurity Solutions and Services market
- 2. Use of questionnaire-based surveys of service providers/vendor across all trend topics
- 3. Interactive discussions with service providers/vendors on capabilities & use cases
- 4. Leverage ISG's internal databases & advisor knowledge & experience (wherever applicable)
- 5. Use of Star of Excellence CX-Data

- Detailed analysis & evaluation of services & service documentation based on the facts & figures received from providers & other sources.
- 7. Use of the following key evaluation criteria:
 - * Strategy & vision
 - * Tech Innovation
 - * Brand awareness and presence in the market
 - * Sales and partner landscape
 - * Breadth and depth of portfolio of services offered
 - * CX and Recommendation

IPL Product Owner

Jan Erik Aase Partner and Global Head – ISG Provider Lens™

Mr. Aase brings extensive experience in the implementation and research of service integration and management of both IT and business processes. With over 35 years of experience, he is highly skilled at analyzing vendor governance trends and methodologies, identifying inefficiencies in current processes, and advising the industry. Jan Erik has experience on all four sides of the sourcing and vendor governance lifecycle - as a client, an industry analyst, a service provider and an advisor.

Now as a research director, principal analyst and global head of ISG Provider Lens™, he is very well positioned to assess and report on the state of the industry and make recommendations for both enterprises and service provider clients.

About Our Company & Research

İSG Provider Lens

The ISG Provider Lens™ Quadrant research series is the only service provider evaluation of its kind to combine empirical, data-driven research and market analysis with the real-world experience and observations of ISG's global advisory team. Enterprises will find a wealth of detailed data and market analysis to help guide their selection of appropriate sourcing partners, while ISG advisors use the reports to validate their own market knowledge and make recommendations to ISG's enterprise clients. The research currently covers providers offering their services across multiple geographies globally.
