

## Identification of the main language of the document - for millions of document

What do you do when your team has to review millions of documents from different countries? How can you quickly understand which documents are in English and which are in other languages, such as Hebrew, Russian, Arabic or Spanish?

Of course, you can always review each document manually and determine the language yourself. But imagine doing so when you have millions of documents! Using our eDiscovery platforms, you can easily and quickly do so. Each document is automatically analyzed, and the main document language is identified, as well as secondary languages.

Doing so, you can quickly estimate which languages are prominent and make sure that your team includes people who speak these languages. You can also quickly assign these documents to the relevant team members.
