

# Financial processes analyser (FPA)

## Data Quality

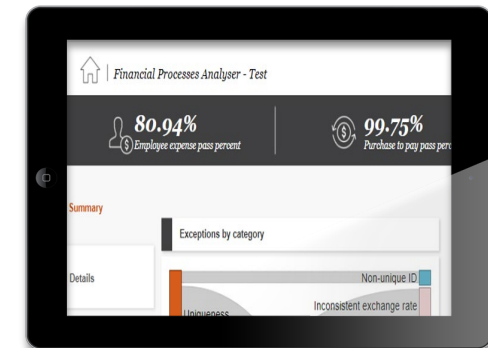

Financial Processes Analyser (FPA) is only as good as the data entered. The FPA data quality report equips a business with insights to prioritize applications for remediation. FPA's data quality module reviews the system data against four attributes such as uniqueness, accuracy, consistency and completeness.

It helps improve the precision of the financial data gathered to run tests and insights. The data quality report identifies exceptions with insufficient or inaccurate details by users, categories, rules and sub-rules.

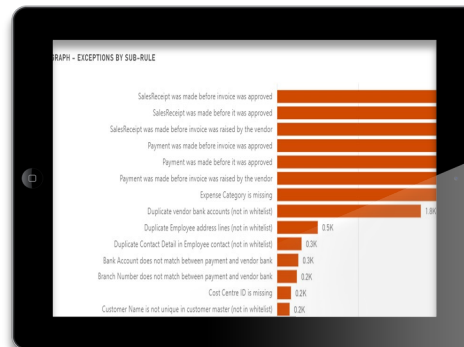

### Sample dashboards

**Get an overview of exceptions by Data Quality category** linked to table fields across all the business processes

**Compare pass percentage of data quality** by Employee Expense, Purchase to Pay, Order to Cash and Payroll modules

**Pick out exceptions by sub-rule** to examine inconsistencies in data

Table Name	Field Name	Data Type
Cardholder Master	Card Holder ID	nvarchar
Cardholder Master	Card Holder Name	nvarchar
Cardholder Master	Card Number	nvarchar

**Zoom into data profiling details** and identify unusual characteristics within individual tables
